

IPMP

- IPMP (intensive Protocol Monitoring and Probing)

Is a technology developed by the "My Server Alert" technical team. The procedure know to us as "IPMP" consist of a very complex algorithm and escalation procedures that take place on our master servers making sure that the information it is retrieving is accurate. While the Monitoring and Probing is very intensive it will not create bandwidth spikes nor socket errors. After Long and intensive simulations the software was given the big "OK" to be offed to the public. Unlike other Monitoring services that all use the same technology "IPMP" is 100% exclusive to "My Server Alert".
